

TRAINING HANDBOOK

Perfumery Compliance: A Practical Guide for Independent Perfumers

IFRA calculations, supplier documents, allergens, CPSR/PIF and market requirements for the UK, EU and US, explained for beginners.

Written September 2026 · IFRA Standards in force: 51st Amendment (52nd Amendment expected to be notified late 2026)

Educational material only. Not legal, regulatory or toxicological advice.

DISCLAIMER

This guide is for educational purposes only and is not legal, regulatory or toxicological advice. Regulations and IFRA Standards change over time. Always verify requirements against current official guidance, supplier documentation, and where appropriate a qualified cosmetic safety assessor.

How to use this guide

- **Complete beginners:** read Sections 1–7 in order, then jump to the [Cheat Sheet](#) at the end.
- **Making your first product for sale:** read everything, and pay special attention to Sections 12–17 (CPSR, PIF, UK, EU, US, transport).
- **Already selling:** use Sections 18–22 (mistakes, worked example, workflow, spreadsheet, research method) as an audit checklist.

About the numbers in this guide

This guide **never invents real IFRA limits**. Wherever a limit is used in a calculation, it is either:

- clearly marked **HYPOTHETICAL** (an educational number chosen to make the maths easy), **or**
- described without a number, with instructions on where to find the real value.

Do **not** copy any hypothetical number from this guide into a real formula or document. Always read the current Standard in the [IFRA Standards Library](#).

Fixed legal thresholds that come from law (for example the EU/UK allergen labelling thresholds of 0.001% and 0.01%) are real and are cited to their sources.

Callout boxes used in this guide

IMPORTANT

something that can cause a real compliance problem.

COMMON MISTAKE

an error that beginners (and some professionals) make.

EXAMPLE

a worked or practical example.

GOOD PRACTICE

a habit that makes compliance easier.

1. What Does "Compliance" Mean in Perfumery?

"Compliance" is not one thing. It is a collection of **separate systems**, each answering a different question. A perfume can pass one and fail another.

1.1 The building blocks

Term	What it is	The question it answers	Legally required?
IFRA compliance	Meeting the fragrance industry's own safety Standards, published by the International Fragrance Association	"Is each fragrance ingredient used at or below the level IFRA considers safe for this type of product?"	IFRA Standards are a voluntary industry self-regulation system. They are compulsory for IFRA members and widely demanded by customers and safety assessors — but they are not, in themselves, UK/EU/US law.
Cosmetic safety assessment	A scientific assessment of the <i>whole finished product</i> by a qualified person	"Is this finished product safe for human health under normal and reasonably foreseeable use?"	Yes in the UK and EU (Article 10 of the Cosmetics Regulation). The US has a different "safety substantiation" duty (Section 16).
CPSR	Cosmetic Product Safety Report — the written output of the safety assessment	"Where is the documented evidence that the product is safe?"	Yes in the UK and EU.
PIF	Product Information File — the complete technical dossier for a cosmetic	"Can the Responsible Person show an inspector everything about this product?"	Yes in the UK and EU.
SDS	Safety Data Sheet — hazard communication for <i>chemicals and mixtures</i>	"What are the hazards of handling this raw material/concentrate, and how should it be stored, handled, transported and disposed of?"	Required for hazardous substances/mixtures supplied to professional users under REACH/UK REACH. Finished cosmetics for consumers are exempt.
CLP	Classification, Labelling and Packaging of chemicals (EU Regulation (EC) No 1272/2008; GB CLP in Great Britain)	"Is this chemical/mixture hazardous, and how must its container be labelled?"	Yes for raw materials and fragrance concentrates. Finished cosmetic products in the hands of the consumer are exempt from CLP labelling.
Allergen declarations	Supplier statements listing regulated fragrance allergens present in a material	"Which labelled allergens are present, and at what %?"	The supplier document is a commercial tool; the labelling of allergens on the finished cosmetic is a legal requirement in the UK/EU.
Ingredient documentation	Specifications, COAs, TDSs, GC/MS, INCI names, origin, etc.	"Exactly what is this material, and is it the same every batch?"	Needed to build the CPSR and PIF.

Term	What it is	The question it answers	Legally required?
Product notification	Registering the product with the authority before sale (SCPN in GB, CPNP in the EU, registration & listing in the US)	"Does the regulator know this product is on the market, and who is responsible?"	Yes , in all three (with some US small-business exemptions).
Labelling	The information on the pack	"Does the consumer get legally required information (ingredients, warnings, Responsible Person, batch, quantity, etc.)?"	Yes .
Stability/compatibility testing	Testing that the product stays safe and acceptable over time and in its packaging	"Will this perfume still be safe and as-described after months on a shelf, in this bottle, with this pump?"	Stability information is a required part of the CPSR (Annex I, Part A) in the UK/EU.
GMP	Good Manufacturing Practice — organised, hygienic, traceable manufacturing (ISO 22716 is the reference standard)	"Was this made in a controlled, traceable, repeatable way?"	Yes in UK/EU (Article 8). US GMP regulations are being developed under MoCRA.

1.2 Why "IFRA compliant" does NOT mean "legal to sell"

An IFRA Certificate tells you only that the **fragrance concentrate**, used at or below a stated level in a stated product category, meets the **IFRA Standards**. It says nothing about:

- whether the **finished product** has been safety-assessed (CPSR);
- whether a **Responsible Person** exists;
- whether the product has been **notified** (SCPN/CPNP);
- whether the **label** is correct (allergens, ingredients, warnings, address, batch code);
- whether the product was made under **GMP**;
- whether the product complies with **legal bans and restrictions** that are separate from IFRA (e.g. Annexes II and III of the UK/EU Cosmetics Regulation);
- whether the **packaging** is compatible and the product is **stable**;
- whether the product can legally be **shipped**.

IMPORTANT

IFRA compliance is **one input** into the safety assessment. It is necessary in practice, but it is never sufficient on its own.

COMMON MISTAKE

"My supplier gave me an IFRA Certificate, so my perfume is compliant."

Reality: the certificate covers the concentrate against the IFRA Standards only. You still need everything else in this section before selling a finished cosmetic in the UK or EU.

1.3 Three different roles — and how responsibility changes

Situation	What you are legally doing	Main obligations (UK/EU view)	You are usually not responsible for...
1. A perfumer creating a fragrance concentrate (for their own use, testing, or as a creative service)	Formulating a chemical mixture	Knowing your raw materials; keeping formula records; calculating IFRA limits; managing lab safety (SDSs for your raw materials). If you <i>supply</i> the concentrate to anyone, see row 2.	The finished cosmetic's CPSR/notification — unless you also put it on the market (row 3).
2. A fragrance house supplying concentrate to another business	Supplying a chemical mixture to a professional user	Chemical law: hazard classification and CLP labelling of the concentrate; SDS (REACH/UK REACH Article 31) where the mixture is hazardous; poison-centre notification (UFI) where applicable in the EU. Commercial/IFRA: IFRA Certificate of Conformity, allergen declaration, and information the customer's safety assessor needs (often under confidentiality).	The customer's CPSR, notification and cosmetic labelling — those belong to the brand's Responsible Person. You must give them accurate information to do it.
3. A brand placing a finished alcoholic perfume on the market	Placing a cosmetic product on the market	Cosmetics law: Responsible Person, safety assessment/CPSR, PIF, GMP, notification (SCPN/CPNP), cosmetic labelling (including allergens), adverse-effect handling. Plus transport rules when shipping.	Chemical CLP labelling on the <i>consumer</i> bottle (cosmetics are exempt in their finished state), but CLP/SDS obligations still apply to the concentrate and alcohol you store and handle.

EXAMPLE

one person, several roles

Sam formulates a concentrate (Role 1), bulks it in ethanol, bottles it, and sells it under their own brand (Role 3). Sam also sells the same concentrate to a candle maker (Role 2).

- For the perfume, Sam needs a CPSR, PIF, Responsible Person, notification and compliant labels.
- For the concentrate sold to the candle maker, Sam needs CLP classification and labelling, an SDS if hazardous, and an IFRA Certificate covering **Category 12** (candles) — plus, if the candle maker sells in the UK/EU, the candle itself has its own **CLP** obligations (candles are not cosmetics).

IMPORTANT

"perfume oil" sold to consumers

A concentrate sold to consumers **to put on their skin** (e.g. a roll-on perfume oil) is a **cosmetic product**. A concentrate sold to consumers **for DIY blending** is a **chemical mixture** and falls under CLP (and you should not market it for skin application without meeting cosmetics law). The intended use you communicate determines which rules apply.

2. Understanding IFRA

2.1 What is IFRA?

The **International Fragrance Association (IFRA)** is the global representative body of the fragrance industry. Its members (fragrance houses and national associations) cover a large majority of global fragrance production. IFRA runs a **self-regulatory** safety programme for fragrance ingredients.

Source: [IFRA — IFRA Standards](#)

2.2 What are the IFRA Standards?

The **IFRA Standards** are documents that **ban, limit, or set purity criteria** for certain fragrance ingredients. Each Standard gives the maximum acceptable concentration **in the finished consumer product** for each product category.

They are based on safety assessments performed by the **Research Institute for Fragrance Materials (RIFM)** and reviewed by an independent **Expert Panel for Fragrance Safety**. Common reasons for a Standard include:

- **dermal sensitisation** (causing skin allergy) — assessed with a Quantitative Risk Assessment (QRA) approach, which is why limits differ by category;
- **systemic toxicity**;
- **phototoxicity** (reaction on sun-exposed skin — e.g. furocoumarins in some citrus oils);
- **impurities or oxidation products**.

Sources: [IFRA — Understanding the Standards](#), [IFRA — Using the Standards](#)

2.3 What is the IFRA Code of Practice?

The **IFRA Code of Practice** is the industry's overall commitment to safe use of fragrance. The IFRA Standards are a major part of it. It also covers good manufacturing and handling of fragrance ingredients and mixtures. Compliance is compulsory for IFRA members. Source: [IFRA Code of Practice](#)

2.4 How IFRA Standards are updated — "Amendments"

IFRA publishes changes in batches called **Amendments** (e.g. "49th Amendment", "51st Amendment"). Each Amendment:

1. goes through a **consultation** period;
2. is formally **notified** (published);
3. has **implementation dates** — usually separate dates for **new creations** and **existing creations**, and sometimes different dates for prohibitions versus restrictions/specifications.

Status at the time of writing (September 2026):

Amendment	Status	Key dates (verify on IFRA's site)
51st Amendment	In force. Notified 30 June 2023.	Reported implementation dates: <i>prohibitions</i> — new creations 30 Aug 2023, existing creations 30 July 2024; <i>restrictions & specifications</i> — new creations 30 March 2024, existing creations 30 Oct 2025. (IFRA notification ; summary in UL Solutions)
52nd Amendment	Consultation ran 12 Dec 2025 – 12 June 2026. Formal notification expected around late November 2026 .	Reported to propose ~51 new and ~18 revised Standards, removal of several outdated Standards, and a revised furocoumarin approach (a cumulative limit covering several phototoxic substances found in citrus oils). (IFRA — 52nd Amendment consultation ; IFRA — consultation closed)

IMPORTANT

IFRA implementation dates relate to the date the **fragrance mixture** is placed on the market (i.e. supplied by the fragrance supplier), **not** the date a finished consumer product reaches a shop shelf. Read the "Guidance for the use of IFRA Standards" for the exact definitions of *new* and *existing* creations.

IMPORTANT

the 52nd Amendment

If you are reading this after late 2026, the 52nd Amendment has probably been notified. **Check every restricted material in your formulas against the new Standards**, especially citrus oils (furocoumarins) and any material that gains a new Standard. Your supplier's certificates will need to be reissued against the new Amendment.

2.5 Why restrictions change

- **New safety data** (new studies, clinical reports, better exposure data).
- **Better methods** (e.g. updated sensitisation risk assessment).
- **Updated consumer exposure data** (how much of a product people actually use).
- **New materials** entering common use.
- **Regulatory developments** (e.g. a substance classified as CMR under chemicals law).

Limits can go **down, up, or be removed**, and materials can move from restricted to prohibited.

2.6 Why supplier documents must match the current Amendment

A supplier's IFRA Certificate states which Amendment it was calculated against. A certificate issued under the **49th** Amendment tells you nothing reliable about the **51st** (or the upcoming 52nd).

GOOD PRACTICE

Record the **Amendment number** and **issue date** of every IFRA document in your records. When a new Amendment is notified, request updated certificates from every supplier.

2.7 The four kinds of material

Type	Meaning	What you do
Prohibited	Must not be used as a fragrance ingredient (in any category).	Do not use. Check naturals and bases for it as a <i>constituent</i> too.
Restricted	May be used, but only up to a maximum level per product category.	Calculate finished-product levels (Sections 5–6).
Subject to specification	May be used only if it meets a purity/quality criterion (e.g. limits on an impurity, an oxidation measure such as peroxide value, or a particular botanical source/processing). Some Standards combine a specification and a restriction.	Get supplier confirmation (spec/COA/IFRA statement) that the material meets the specification.
Unrestricted (no IFRA Standard)	IFRA has not issued a Standard for it.	Use responsibly — see below.

2.8 "No IFRA restriction" ≠ "unlimited use"

A material with **no IFRA Standard** can still be limited by:

- **Law:** UK/EU Cosmetics Regulation **Annex II** (prohibited substances) and **Annex III** (restricted substances, including allergen labelling). Some substances are banned by law for other reasons (e.g. classification as carcinogenic, mutagenic or toxic for reproduction — "CMR").
- **The safety assessor:** the CPSR assessor may set a lower level based on toxicology, irritation, or the specific product.
- **Hazard classification:** a material may be a skin sensitiser or irritant under CLP even without an IFRA Standard.
- **Supplier recommendations:** usage advice based on odour strength, stability, discolouration, or safety data.
- **Practical factors:** discolouration, instability, reactivity with other materials.

EXAMPLE

Several materials were banned in EU cosmetics by law (e.g. **butylphenyl methylpropional**, "Lilial", banned in the EU from March 2022 due to reproductive toxicity classification; **HICC**/"Lyrall", **atranol** and **chloroatranol** banned in EU cosmetics under Regulation (EU) 2017/1410). Legal bans can arrive through chemical classification routes, independent of IFRA's timetable. Always check the current Annex II of the relevant cosmetics regulation.

Sources: [EU CosIng database](#)

3. Understanding IFRA Categories

3.1 Why categories exist

Skin exposure is very different for a lipstick, a perfume, a shower gel and a candle. IFRA groups products into **categories** based on how much of the product reaches the skin (or mouth, eyes, etc.) and for how long. **Each IFRA Standard gives a separate limit for each category.**

Since the 49th Amendment there are **12 main categories**, several with sub-categories (e.g. 5A–5D, 7A–7B, 10A–10B, 11A–11B).

3.2 IFRA Category 4 — Fine Fragrance

Category 4 covers products related to **fine fragrance** — the category most independent perfumers work in. Products commonly assigned to Category 4 include:

- Eau de Parfum, Eau de Toilette, Parfum/Extrait, Eau de Cologne (hydroalcoholic fine fragrances);
- non-hydroalcoholic fine fragrances such as perfume oils and solid perfumes;
- certain other fragranced products that IFRA's categorisation guidance places here.

IMPORTANT

borderline products

Body mists, hair mists, aftershaves, scented body oils, fragranced deodorant sprays and similar products may **not** be Category 4, or may be placed in Category 4 only under specific descriptions.

Always look up your exact product type in IFRA's official product-category guidance (in the *Guidance for the use of IFRA Standards*, available from the [IFRA Standards documentation page](#)). Do not guess.

3.3 Commonly encountered categories

IFRA Category	Plain-English description	Typical examples
1	Products applied to the lips	Lipstick, lip balm
2	Products applied to the underarms (axillae)	Deodorants, antiperspirants
3	Products applied to the face/body using fingertips	Certain eye-area and facial products (see IFRA guidance)
4	Fine fragrance	EDP, EDT, parfum, cologne, perfume oils
5A	Body lotions applied with the hands (leave-on)	Body lotion, body cream
5B	Face moisturisers	Face cream
5C	Hand creams	Hand cream
5D	Baby creams, oils, talcs	Baby lotion
6	Products with oral and lip exposure	Toothpaste, mouthwash
7A	Rinse-off hair products	Shampoo, rinse-off conditioner
7B	Leave-on hair products	Hair sprays, styling products
8	Products with significant anogenital exposure	Intimate wipes and similar

IFRA Category	Plain-English description	Typical examples
9	Rinse-off body products	Bar soap, shower gel
10A / 10B	Household care (non-spray / spray)	Detergents, surface cleaners / household aerosols
11A / 11B	Products with intended skin contact but minimal transfer from an inert substrate (without / with UV exposure)	Certain fragranced articles (see IFRA guidance)
12	Products not intended for skin contact, minimal/insignificant transfer	Candles, reed diffusers, plug-in air fresheners

Table simplified for teaching. The official category definitions and full example lists are in IFRA's Guidance document — use that, not this table, for final decisions.

3.4 Same formula, different limits

Because each category has its own limit, **the same concentrate** can have different maximum use levels:

EXAMPLE

one concentrate, many products (HYPOTHETICAL numbers)

A supplier's IFRA Certificate for "Rose Accord 123" might state something like:

Category	Product	Max use of the concentrate in finished product
4	Fine fragrance	12.5%
5A	Body lotion	2.1%
9	Soap / shower gel	9.8%
12	Candle	100%

All numbers are HYPOTHETICAL. The pattern is the lesson: a concentrate may be allowed at a higher dosage in a candle than in a lotion, because exposure is completely different. The limiting ingredient can also be **different** in each category.

COMMON MISTAKE

Using the Category 4 figure for a body lotion or body mist "because it's the same scent". The category follows the **finished product**, not the fragrance.

4. How to Read an IFRA Standard

4.1 The structure of a Standard

Every IFRA Standard is a separate document (PDF) in the [IFRA Standards Library](#). The library is searchable by name and CAS number. A typical Standard includes:

Section	What to look for
Name	The material name IFRA uses.
CAS number(s)	One or more CAS Registry Numbers covered.
Synonyms	Other names, including common trade names and chemical names.
Amendment / publication / implementation dates	Which Amendment the version belongs to and when it applies.
Type of Standard	Prohibition, Restriction, Specification (or combination).
Intrinsic property driving risk management	E.g. dermal sensitisation, systemic toxicity, phototoxicity.
Limits by category	A table with the maximum concentration in the finished product for each IFRA category.
Specification details	Purity criteria, impurity limits, etc., if any.
Contributions from other sources	Whether the limit includes amounts coming from natural materials or other ingredients.
Notes / footnotes	Exceptions, special conditions, combined limits.
Expert Panel rationale / references	The scientific basis (RIFM assessment).

4.2 A walk-through with a FICTIONAL Standard

The following mock-up is **invented for teaching**. It does not represent any real material.

EXAMPLE

FICTIONAL IFRA Standard (teaching mock-up — not real)

Name: Exampleol

CAS No.: 00000-00-0 (*fictional*)

Synonyms: 2-Example-3-teachanol; "Teachal"

Amendment: 51st · **Type:** RESTRICTION

Intrinsic property driving risk management: Dermal sensitisation

Category	Max concentration in finished product
1	0.0X%
2	0.0X%
3	0.X%
4	0.60% (HYPOTHETICAL)
5A	0.1X%
...	...
12	No restriction

Contributions from other sources: Exampleol can be present in some essential oils. The limits apply to the **total** concentration from all sources.

Notes: Material must meet the purity specification in the Specification section.

How to read it:

1. **Material name, CAS, synonyms** — confirm that *your* material is the same substance. Check your supplier's SDS/specification CAS and name match.
2. **Restriction type** — here it's a *restriction*, so there's a maximum level.
3. **Category 4 limit** — 0.60% (hypothetical) of the **finished product**, i.e. of the finished perfume including alcohol, not of the concentrate.
4. **Raw material or constituent?** — the "contributions from other sources" note tells you the limit applies to the **substance wherever it comes from**, including naturals that contain it. You must add up every source.
5. **Specification** — you need confirmation from your supplier that the material meets the stated purity criteria.
6. **Notes/footnotes** — read every one. They often contain the exception that matters to you.

4.3 Why CAS numbers matter — and why not to use them blindly

A **CAS number** is a unique identifier for a chemical substance, assigned by the Chemical Abstracts Service. It is the best quick way to match a material to a Standard, **but**:

- **One material can have several CAS numbers** (e.g. different isomer mixtures, racemic vs single isomer, older and newer numbers).
- **Natural materials** often have more than one CAS number (e.g. a botanical-species number, a generic "oil" number, a number for an extract made a different way), and the numbers sometimes don't distinguish between an oil and an absolute.
- **Trade names** (e.g. a supplier's branded material) may be mixtures of several CAS-numbered substances.
- **Typographical errors** on documents happen.

- A Standard may list only some CAS numbers, yet the **definition** or **synonyms** make clear it applies to related forms.

GOOD PRACTICE

Identify a material using **all** of: CAS number, chemical/INCI name, botanical name (for naturals), supplier trade name, and supplier documents. If the IFRA Library search by CAS finds nothing, also search by **name and synonyms** before concluding "no Standard".

4.4 Natural materials containing restricted constituents

Essential oils and other naturals are **mixtures** of many chemicals. Some of those chemicals are individually subject to IFRA Standards and/or are regulated allergens. Examples of constituents commonly found in naturals:

Constituent	Commonly found in (examples — levels vary widely)	Why it matters (verify current status)
Limonene	Citrus peel oils (orange, lemon, bergamot, mandarin)	UK/EU labelled allergen; IFRA has a Standard relating to oxidation (specification).
Linalool	Lavender, bergamot, coriander, bois de rose	UK/EU labelled allergen; IFRA has a Standard relating to oxidation (specification).
Citral (geranial + neral)	Lemongrass, litsea cubeba, lemon, melissa	UK/EU labelled allergen; IFRA Standard (restriction).
Eugenol	Clove, cinnamon leaf, pimento, bay	UK/EU labelled allergen; IFRA Standard (restriction).
Coumarin	Tonka bean absolute, cassia, some hay-type materials	UK/EU labelled allergen; IFRA Standard (restriction).
Methyl eugenol	Basil, laurel leaf, rose, some others	IFRA Standard (restriction), including limits that apply to naturals; also regulated in EU cosmetics law.
Geraniol / Citronellol	Rose, geranium, palmarosa, citronella	UK/EU labelled allergens; IFRA Standards may apply — check.
Furocoumarins (e.g. bergapten)	Cold-pressed citrus oils, esp. bergamot, lime, grapefruit	Phototoxicity — IFRA Standard; proposed changes in 52nd Amendment.

Always check the current Standard for each of these. Whether a material is restricted, specified, or both — and the actual limits — must come from the IFRA Standards Library.

IMPORTANT

A formula may contain **no** material named "citral" and still contain a significant amount of citral from lemongrass or litsea. **Restrictions can arise from constituents, not just raw material names.** IFRA also publishes an **Annex on "Contributions from Other Sources"** giving typical levels of certain restricted substances in natural materials — useful when you have no better data, but supplier batch data should come first where available.

5. How to Calculate IFRA Compliance

This is the core skill. Take it slowly.

5.1 Three percentages you must never mix up

#	Percentage	Plain English	Example
1	Material % in concentrate	How much of the fragrance oil is this material?	"Material X is 2% of my concentrate."
2	Concentrate % in finished product (the <i>dosage</i>)	How much of the finished perfume is fragrance oil?	"My EDP is 20% concentrate, 80% alcohol/water."
3	Material % in finished product	How much of the bottle the customer sprays is this material?	"Material X is 0.4% of the finished perfume."

IFRA limits are expressed as #3 — the % in the finished product.

IMPORTANT

weight, not volume

IFRA percentages are **by weight (w/w)**. If you dose by volume, convert using density (see Section 5.6).

5.2 The core formula

Finished-product material concentration (as a fraction)
= (material % in concentrate ÷ 100) × (concentrate % in finished product ÷ 100)

Finished-product material concentration (%)
= that fraction × 100

A shortcut that gives the same answer in one step:

Material % in finished product = (material % in concentrate × concentrate % in finished product) ÷ 100

5.3 Example 1

EXAMPLE 1

A raw material is used at **2%** of the fragrance concentrate. The perfume contains **20%** fragrance concentrate.

Step 1 — Convert percentages to fractions

$$2\% \div 100 = 0.02$$

$$20\% \div 100 = 0.20$$

Step 2 — Multiply

$$0.02 \times 0.20 = 0.004$$

Step 3 — Convert back to a percentage

$$0.004 \times 100 = \mathbf{0.4\%}$$

Check with the shortcut: $(2 \times 20) \div 100 = 40 \div 100 = 0.4\%$ ✓

Result: the material is present at **0.4% of the finished perfume**.

Sanity check in grams: in 100 g of perfume there are 20 g of concentrate. 2% of 20 g = $0.02 \times 20 \text{ g} = 0.4 \text{ g}$. 0.4 g in 100 g = 0.4%. ✓

5.4 Example 2

EXAMPLE 2

A material is used at **5%** of the concentrate. Finished perfume concentration = **25%**.

Step 1: $5\% \div 100 = 0.05$; $25\% \div 100 = 0.25$

Step 2: $0.05 \times 0.25 = 0.0125$

Step 3: $0.0125 \times 100 = \mathbf{1.25\%}$

Shortcut: $(5 \times 25) \div 100 = 125 \div 100 = 1.25\%$ ✓

Grams check: 100 g perfume → 25 g concentrate → 5% of 25 g = 1.25 g → 1.25%. ✓

Result: the material is **1.25% of the finished perfume**. You would compare **1.25%** (not 5%) to the Category 4 limit.

5.5 Example 3 — working backwards from a limit

Now the reverse question: *"If the limit is X, how much can I put in my concentrate?"*

Maximum material % in concentrate

$$= \text{IFRA finished-product limit (\%)} \div (\text{concentrate \% in finished product} \div 100)$$

or equivalently:

Maximum material % in concentrate

$$= (\text{IFRA finished-product limit (\%)} \times 100) \div \text{concentrate \% in finished product}$$

IMPORTANT

Units: divide the limit by the dosage **as a fraction** (e.g. 0.20, not 20). If you divide by 20 you'll get an answer 100 times too small.

EXAMPLE 3

(HYPOTHETICAL limit)

A material has a Category 4 IFRA maximum of **0.60%** in the finished product (*HYPOTHETICAL — for teaching only*). What is the most you could use in a concentrate dosed at 10%, 15%, 20%, 25% and 30%?

Perfume dosage	Dosage as fraction	Calculation	Max % in concentrate
10%	0.10	$0.60 \div 0.10$	6.00%
15%	0.15	$0.60 \div 0.15$	4.00%
20%	0.20	$0.60 \div 0.20$	3.00%
25%	0.25	$0.60 \div 0.25$	2.40%
30%	0.30	$0.60 \div 0.30$	2.00%

Check one of them: at 25% dosage with 2.40% in the concentrate $\rightarrow (2.40 \times 25) \div 100 = 60 \div 100 = 0.60\%$ ✓ exactly at the limit.

Pattern: the stronger the perfume (higher dosage), the **less** of the restricted material you can put in the concentrate.

IMPORTANT

this is a theoretical maximum

The result must still account for: - **other sources** of the same substance (naturals, bases, other materials — Section 8); - **other restricted materials** in the formula (Section 6 — the lowest one wins); - **specifications** (purity/oxidation) that must also be met; - **legal limits** (e.g. Annex III of the Cosmetics Regulation) that might be stricter; - **supplier recommendations** and **the safety assessor's conclusions**; - a sensible **safety margin** for batch variation and weighing tolerance.

Formulating *exactly* at the limit leaves no room for weighing errors or natural variation.

5.6 Volume vs weight — a practical trap

Many hobbyists measure in **millilitres**. IFRA works in **weight %**.

EXAMPLE

"20% by volume" is not "20% by weight"

You mix **20 ml** of concentrate with **80 ml** of perfumer's alcohol.

Assume concentrate density = 0.98 g/ml and perfumer's alcohol ($\approx 96\%$ ethanol) density ≈ 0.81 g/ml (use your actual supplier values).

Concentrate mass = $20 \text{ ml} \times 0.98 \text{ g/ml} = \mathbf{19.6 \text{ g}}$

Alcohol mass = $80 \text{ ml} \times 0.81 \text{ g/ml} = \mathbf{64.8 \text{ g}}$

Total mass = $19.6 + 64.8 = \mathbf{84.4 \text{ g}}$

Concentrate % by weight = $19.6 \div 84.4 = 0.2322 \rightarrow \times 100 = \mathbf{23.2\% \text{ w/w}}$

So your "20%" perfume is actually **$\sim 23.2\% \text{ w/w}$** for IFRA purposes. If your certificate allowed 20% max, you'd be over the limit.

Solution: weigh everything on a calibrated scale, and express formulas in grams / % w/w.

6. Calculating Maximum Fragrance Dosage

6.1 The formula

This asks: "What is the highest % at which I can use this whole concentrate before this one restricted material exceeds its limit?"

Maximum fragrance usage (as a fraction)
= IFRA limit for restricted material (%)
÷ concentration of that restricted material in the concentrate (%)

Maximum fragrance usage (%) = that fraction × 100

If the answer is **above 100%**, that material does **not** limit the concentrate in that category (the concentrate could even be used neat as far as that material is concerned — but see the warnings below).

6.2 Worked examples

EXAMPLE 6A

(HYPOTHETICAL limit)

Material A is **3.0%** of the concentrate. Its Category 4 limit is **0.60%** (*hypothetical*).

$0.60 \div 3.0 = 0.20 \rightarrow 0.20 \times 100 = \mathbf{20\%}$

The concentrate can be used at up to **20%** in fine fragrance (as far as Material A is concerned).

Check: at 20% dosage: $(3.0 \times 20) \div 100 = 0.60\%$ ✓

EXAMPLE 6B

(HYPOTHETICAL limit)

Material B is **0.50%** of the concentrate. Its Category 4 limit is **0.05%** (*hypothetical*).

$0.05 \div 0.50 = 0.10 \rightarrow \mathbf{10\%}$

Check: $(0.50 \times 10) \div 100 = 0.05\%$ ✓

EXAMPLE 6C

(HYPOTHETICAL limit)

Material C is **2.0%** of the concentrate. Its Category 4 limit is **2.5%** (*hypothetical*).

$2.5 \div 2.0 = 1.25 \rightarrow \mathbf{125\%}$

That's more than 100%, so Material C **cannot** exceed its limit at any dosage. It is not a limiting material in this category.

6.3 The limiting material

When a formula contains **several** restricted materials, calculate the maximum dosage for **each**. The one giving the **lowest** result is the **limiting material**, and that result is the maximum dosage for the whole concentrate.

EXAMPLE 6D

a formula with several restricted materials (ALL LIMITS HYPOTHETICAL)

Material	% in concentrate	Cat 4 limit (HYPOTHETICAL)	Calculation	Maximum fragrance dosage
Material A	3.00%	0.60%	$0.60 \div 3.00 = 0.200$	20.0%
Material B	0.50%	0.05%	$0.05 \div 0.50 = 0.100$	10.0% ← lowest
Material C	2.00%	2.50%	$2.50 \div 2.00 = 1.250$	125% (not limiting)
Material D (constituent from an essential oil)	0.12%	0.02%	$0.02 \div 0.12 = 0.167$	16.7%

Limiting material: Material B. The concentrate may be used at **no more than 10%** in Category 4.

If you want to make a 20% EDP, you must reduce Material B. Using the Section 5.5 formula:
Max Material B in concentrate at 20% = $0.05 \div 0.20 = \mathbf{0.25\%}$.

But now also check Material D at 20%: $0.12 \times 20 \div 100 = 0.024\% > 0.02\% \mathbf{x}$ — so Material D **also** needs reducing (to $\leq 0.02 \div 0.20 = 0.10\%$ in the concentrate).

Lesson: fixing the limiting material often reveals the *next* limiting material. Recalculate everything after every change.

6.4 Maximum IFRA dosage ≠ recommended perfume concentration

The maximum IFRA dosage is a **ceiling**, not a target. Your actual dosage also depends on:

- the **olfactory** result (more isn't always better);
- **cost**;
- **stability**, solubility and clarity in alcohol;
- **safety assessor** conclusions;
- **legal** limits and allergen labelling;
- a sensible **safety margin** below the ceiling.

EXAMPLE

A concentrate's IFRA certificate allows 18.2% in Category 4. The brand chooses **15%** for its EDP: it smells balanced, stays clear at low temperatures, and leaves a margin for batch-to-batch variation in the natural materials.

7. Raw Materials vs Dilutions

Perfumers constantly use **dilutions** (e.g. "10% in DPG", "1% in ethanol") for accurate weighing of strong materials. IFRA limits apply to the **active material**, not the solution.

7.1 Three numbers to keep separate

Term	Meaning
Formula %	How much of the <i>solution</i> is in the formula.
Dilution %	How much of the solution is <i>active material</i> (e.g. 10% = 10 g active in 100 g solution).
Active %	How much <i>actual material</i> ends up in the formula.

7.2 Reusable formulas

Active % in concentrate = Formula % of solution $\times$ (Dilution % $\div$ 100)

Solvent % contributed = Formula % of solution – Active % in concentrate

Active % in finished product = Active % in concentrate $\times$ (Concentrate dosage % $\div$ 100)

Solution % needed for a target active % = Target active % $\div$ (Dilution % $\div$ 100)

7.3 Worked examples

EXAMPLE

Formula contains **5%** of a **10%** solution of a material in DPG.

Active % = $5 \times (10 \div 100) = 5 \times 0.10 = \mathbf{0.5\%}$

Solvent (DPG) from this line = $5 - 0.5 = \mathbf{4.5\%}$

So the formula contains only **0.5%** of the actual material. Use 0.5%, **not** 5%, in IFRA calculations.

EXAMPLE

Formula contains **3%** of a **1%** solution.

Active % = $3 \times (1 \div 100) = 3 \times 0.01 = \mathbf{0.03\%}$

Solvent = $3 - 0.03 = \mathbf{2.97\%}$

In a 20% perfume, the finished-product level = $0.03 \times 0.20 = \mathbf{0.006\%}$.

EXAMPLE

Formula contains **8%** of a **50%** solution (e.g. a crystalline material pre-dissolved at 50%).

Active % = $8 \times (50 \div 100) = 8 \times 0.50 = \mathbf{4.0\%}$

Solvent = $8 - 4 = \mathbf{4.0\%}$

EXAMPLE

You want **0.2%** active of a material and have it as a **10%** dilution.

Solution needed = $0.2 \div 0.10 = \mathbf{2.0\%}$ of the 10% solution.

IMPORTANT

"dilutions" that arrive from suppliers

Some materials are **sold** pre-diluted (e.g. "10% in DPG", "50% in IPM", or naturally occurring as solutions with carriers). Read the specification — the supplier's IFRA certificate may already account for dilution, or may refer to the pure material. Check which one before calculating.

IMPORTANT

solvents are ingredients too

DPG, IPM, benzyl benzoate, triethyl citrate and ethanol are ingredients that must appear in your formula records, your CPSR data and (for the finished product) your ingredient list. **Benzyl benzoate** is itself a UK/EU labelled fragrance allergen, so using it as a diluent affects your allergen calculations.

8. Natural Materials and Restricted Constituents

8.1 Why naturals are harder

A synthetic aroma chemical is usually one substance (or a defined isomer mix). A natural is a **complex, variable mixture** of dozens to hundreds of substances. Its composition depends on species, chemotype, origin, harvest, extraction method, and age.

Natural type	What it is	Compliance challenge
Essential oils	Volatile oils obtained by steam distillation, or expression (citrus)	Contain many allergens and restricted constituents; cold-pressed citrus oils may contain phototoxic furocoumarins.
Absolutes	Solvent-extracted from concretes, then alcohol-washed	Rich, complex; may contain restricted constituents and trace solvent residues.
Resinoids	Solvent extracts of resins/balsams (e.g. benzoin, labdanum)	Often supplied diluted; may contain allergens such as benzyl benzoate, benzyl cinnamate, cinnamyl alcohol.
Balsams	Natural resinous exudates (e.g. Peru, tolu)	Some have their own IFRA Standards, specifications, or legal restrictions — check carefully.
Extracts (CO₂, tinctures, etc.)	Various extraction methods	Composition differs from the oil of the same plant; do not reuse an essential oil's data for a CO ₂ extract.

8.2 What documentation you need for a natural

- **IFRA Certificate/statement** from the supplier for that exact material;
- **Allergen declaration** (ideally batch-based or typical-composition-based);
- **Specification** (botanical name, part, origin, extraction method, physico-chemical data);
- **GC/MS or composition data** where restricted constituents may matter;
- **SDS**;
- **COA** for the batch you're using.

8.3 Simplified educational example

EXAMPLE 8A

constituent contribution (HYPOTHETICAL numbers)

Your concentrate contains **8%** of "Essential Oil E". Your **supplier's** documentation states that Oil E contains **1.5%** of a restricted constituent, "Constituent K". Constituent K has a Category 4 limit of **0.05%** (*HYPOTHETICAL*).

Step 1 — Constituent K in the concentrate

$8\% \times (1.5 \div 100) = 8 \times 0.015 = \mathbf{0.12\%}$ of the concentrate

Step 2 — Add other sources

Your formula also contains 0.03% of Constituent K as a pure material.

Total = $0.12 + 0.03 = \mathbf{0.15\%}$ of the concentrate

Step 3 — Finished-product level at 20% dosage

$0.15 \times 0.20 = \mathbf{0.03\%}$ of the finished perfume → below 0.05% ✓

Step 4 — Maximum dosage from Constituent K

$0.05 \div 0.15 = 0.333 \rightarrow \mathbf{33.3\%}$

IMPORTANT

Constituent percentages **must come from reliable supplier documentation** (allergen declaration, GC/MS, specification or IFRA statement for the specific material), or — where there is no better data — from recognised reference data such as IFRA's annex on contributions from other sources. **Do not** use a random percentage from a website or a different supplier's oil. Where data is given as a *range*, a conservative approach is to use the **upper** value and discuss it with your safety assessor.

COMMON MISTAKE

"It's a natural essential oil, so IFRA doesn't apply." Many of the most heavily restricted substances are found **in naturals**. Some naturals themselves have Standards (e.g. some citrus oils via furocoumarin Standards, oakmoss/treemoss extracts via specifications).

9. How to Navigate Supplier Documents

9.1 SDS — Safety Data Sheet

What it is: a standard 16-section document describing the **hazards** of a substance or mixture and how to handle it safely. In the EU and GB its format is set by REACH/UK REACH Annex II.

What an SDS tells you:

SDS Section	Useful information for perfumers
1	Identification of product and supplier
2	Hazard classification (CLP/GB CLP) — e.g. Skin Sens. 1, Flam. Liq. 3, Aquatic Chronic 2 — and label elements (pictograms, hazard and precautionary statements)
3	Composition — hazardous components above certain thresholds, with CAS/EC numbers (not necessarily the full composition)
7	Handling and storage
8	Exposure controls / PPE
9	Physical properties — including flash point , appearance, density
14	Transport information — UN number, class, packing group
15	Regulatory information

What an SDS does NOT tell you:

- the maximum level for **cosmetic** use;
- **IFRA** compliance or the Category 4 limit;
- whether an ingredient is permitted in cosmetics (it's a chemical-safety document, not a cosmetic one);
- a full allergen breakdown (Section 3 lists **hazardous** components above thresholds, not every labelled allergen);
- whether your finished product is safe.

COMMON MISTAKE

Treating an SDS as proof of cosmetic safety or IFRA compliance. An SDS is **not** an IFRA Certificate and **not** a CPSR.

9.2 IFRA Certificate / IFRA Conformity Document

What it is: a supplier's declaration that the material or fragrance mixture complies with the IFRA Standards **when used at or below stated levels** in stated **product categories**.

What to check:

- **Product name and code** match what you bought;
- **Amendment** stated (e.g. "51st Amendment") — is it current?;
- **Date** of issue;
- **Table of categories** with maximum use levels (% of the concentrate/material in the finished product);
- any **specification** statements (e.g. "complies with the specification for ...");

- signature/issuer details.

IMPORTANT

read the numbers correctly

On an IFRA Certificate for a **raw material or fragrance compound**, the numbers per category are usually the **maximum % of that material/compound in the finished product** — i.e. already a *maximum dosage* — **not** the % of a restricted substance. Read the document's wording.

9.3 Allergen Declaration

What it is: a list of regulated fragrance allergens present in the material, with their concentrations (usually as % in the material).

What it contains (typically):

- the regulatory list it refers to (e.g. the original 26 allergens, and/or the expanded EU list under Regulation (EU) 2023/1545);
- the concentration of each allergen in the material;
- sometimes a statement of basis (typical composition vs batch analysis).

GOOD PRACTICE

Since the EU list expanded, ask suppliers for declarations that cover the **expanded EU list** (and state which list the document covers). A declaration covering only the old 26 allergens is not enough for new EU products placed on the market from 31 July 2026.

9.4 Technical Data Sheet (TDS) / Specification

What it is: a description of what the material **should** be, used to check identity and quality.

Typical information:

- appearance (e.g. "colourless to pale yellow liquid");
- odour description;
- purity/assay (e.g. " $\geq 98\%$ by GC");
- **density / specific gravity;**
- **refractive index;**
- optical rotation (for chiral materials and many naturals);
- flash point;
- solubility;
- botanical source, part used, extraction method, origin (naturals);
- recommended storage conditions and shelf life;
- sometimes typical use levels and stability notes.

9.5 Certificate of Analysis (COA)

What it is: a **batch-specific** document showing the test results for the **exact lot** you received, compared against the specification.

Why it matters: proves *this batch* matches the specification; supports traceability (batch number → your production batch) under GMP.

9.6 Comparison table

Document	Answers	Specific to...	Used for	Is it an IFRA/cosmetic compliance proof?
SDS	Hazards, handling, storage, transport	Product (not batch)	Lab safety, CLP labelling, storage, shipping	✗ No
IFRA Certificate	Max use level per IFRA category	Product + Amendment	IFRA calculations; supplying assessor	✓ IFRA only (not a CPSR)
Allergen Declaration	Which allergens and how much	Product (sometimes batch)	Label ingredient lists; CPSR data	Partial — input to labelling
TDS / Specification	What the material should be	Product	Identity, quality, density for conversions	✗ No
COA	What this batch actually is	Batch	Traceability, GMP, quality check	✗ No
GC/MS / Composition data	What's inside a natural	Batch or typical	Constituent calculations	Supporting data
CPSR	Is the finished product safe?	Finished product	Legal requirement UK/EU	✓ Safety assessment

10. IFRA Certificates for Finished Fragrance Compounds

10.1 How a fragrance house creates one (conceptually)

1. **Break the formula down** to active materials (removing solvent effects from dilutions).
2. **Explode** complex ingredients (bases, accords, naturals) into their relevant constituents using supplier data.
3. For **every** substance with an IFRA Standard — whether added directly or present as a constituent — **sum** all contributions.
4. Check **prohibitions** — none may be present (other than any trace levels specifically allowed).
5. Check **specifications** — each relevant material must meet them.
6. For each IFRA **category**, calculate the maximum dosage for each restricted substance: $\text{Max dosage (\%)} = (\text{Category limit} \div \text{total \% of substance in compound}) \times 100$
7. The **lowest** value in each category is the **maximum use level** of the compound in that category.
8. Issue the certificate stating the Amendment, date, and maximum levels.

10.2 What an IFRA Conformity Certificate should normally show

- Supplier name and address;
- Customer name (often);
- **Fragrance name and code**;
- **IFRA Amendment** used for the evaluation;
- **Date** of issue;
- A statement that the compound complies with the IFRA Standards when used within the stated limits;
- **Table of IFRA categories** with maximum concentration of the compound in the finished product for each;
- Statement regarding specifications and/or prohibited materials;
- Signature / authorised person;
- Often a statement that the limits reflect IFRA Standards only and that the customer remains responsible for overall product safety.

IMPORTANT

a PDF is not proof

Anyone can type numbers into a certificate template. A certificate is only as good as the **formula data, supplier data, constituent data and calculations** behind it. If you create certificates for your own compounds: - keep the full calculation records; - keep every supplier document you relied on (with dates and versions); - use data for the **specific** raw materials you bought; - re-issue when anything changes; - consider having your calculations checked by an experienced regulatory professional or using recognised software — and still check its data sources.

If you are not an IFRA member, you can still calculate IFRA compliance for your own formulas — but be transparent on the document about who produced it, which Amendment was used, and how it was calculated.

11. Fragrance Allergens

11.1 IFRA restrictions vs allergen labelling — two different systems

	IFRA restrictions	Allergen labelling (UK/EU)
Source	Industry self-regulation (IFRA Standards)	Law — Cosmetics Regulation Annex III
Purpose	Keep exposure below levels judged safe	Inform consumers who are already sensitised so they can avoid the substance
Output	Maximum concentration per category	Name must appear in the ingredient list above a threshold
Threshold	Varies per material and category	Fixed: > 0.001% (leave-on) / > 0.01% (rinse-off)

An ingredient can therefore be **legally required on the label** even though it is used far below any IFRA limit — or even though it has **no** IFRA restriction at all. The labelling duty is triggered simply by its presence above the threshold.

EXAMPLE

Linalool may be used without reaching any quantitative IFRA restriction (IFRA's Standard for linalool is about oxidation quality), but at 0.5% in a finished EDP it is far above 0.001% and **must** be listed as "Linalool" in the UK/EU ingredient list.

11.2 The thresholds

Under the UK and EU Cosmetics Regulations, a listed fragrance allergen must be named in the ingredient list when its concentration in the **finished product** exceeds:

- **0.001%** (10 ppm) in **leave-on** products (e.g. perfume, lotion);
- **0.01%** (100 ppm) in **rinse-off** products (e.g. shower gel, shampoo).

The allergen is counted from **all sources** (added directly, from naturals, from bases, from solvents such as benzyl benzoate).

11.3 UK vs EU — the allergen lists

	EU	Great Britain (UK)
Law	Regulation (EC) No 1223/2009, Annex III, as amended by Commission Regulation (EU) 2023/1545	Retained Regulation (EC) No 1223/2009 as it applies in GB ("UK Cosmetics Regulation")
List	Expanded list: the original allergens (minus those since banned) plus 56 new entries (individual chemicals and certain natural extracts) — around 80 entries in total	At the time of writing, GB still uses the original list (the "26 allergens", minus substances since banned). OPSS has been expected to consult on alignment — check the current position .
Transition	Products placed on the market from 31 July 2026 must comply. Products placed on the market before that date may continue to be made available until 31 July 2028 .	Check current OPSS guidance.
Northern Ireland	EU cosmetics rules generally apply in NI under the Windsor Framework — check current guidance.	—

IMPORTANT

Transitional dates and the exact contents of the lists **must be checked from official sources**. The EU amendment also changed how some allergens are **named** on labels (and allows certain naming conventions for groups/isomers). Use the INCI names given in the current Annex III.

GOOD PRACTICE

label to the stricter list

Many brands selling in both markets simply label according to the **EU expanded list**, since listing extra allergens is generally permitted and one label can then serve both markets. Confirm with your Responsible Person/assessor.

11.4 How to calculate allergen % in the finished product

Allergen % in concentrate = $\Sigma [\text{material \% in concentrate} \times (\text{allergen \% in that material} \div 100)]$

Allergen % in finished product = Allergen % in concentrate $\times$ (concentrate dosage % $\div$ 100)

Label it if: leave-on $\rightarrow$ finished % > 0.001 rinse-off $\rightarrow$ finished % > 0.01

EXAMPLE 11A

leave-on EDP

A concentrate contains: - Linalool (pure material): **3.0%** - Lavender oil at **10%**, whose supplier allergen declaration shows **30%** linalool

Step 1 — linalool from lavender: $10 \times (30 \div 100) = 10 \times 0.30 = \mathbf{3.0\%}$

Step 2 — total linalool in concentrate: $3.0 + 3.0 = \mathbf{6.0\%}$

Step 3 — finished EDP at 18%: $6.0 \times (18 \div 100) = 6.0 \times 0.18 = \mathbf{1.08\%}$

Step 4 — compare: $1.08\% > 0.001\% \rightarrow$ **Linalool must be labelled.**

(Real lavender linalool content varies — the 30% here is illustrative; use your supplier's declaration.)

EXAMPLE 11B

same allergen, leave-on vs rinse-off

A concentrate contains **0.40%** of an allergen (from all sources).

Body lotion (leave-on) at 0.5% fragrance:

$0.40 \times (0.5 \div 100) = 0.40 \times 0.005 = \mathbf{0.002\%} \rightarrow > 0.001\% \rightarrow$ **Label.**

Shower gel (rinse-off) at 1.5% fragrance:

$0.40 \times (1.5 \div 100) = 0.40 \times 0.015 = \mathbf{0.006\%} \rightarrow < 0.01\% \rightarrow$ **Not required** on the label.

Same concentrate, different outcomes — because thresholds depend on product type.

EXAMPLE 11C

trace amount

A woody base is 12% of your concentrate; the supplier declares **0.005%** of a listed allergen in it.

In concentrate: $12 \times (0.005 \div 100) = 12 \times 0.00005 = \mathbf{0.0006\%}$

In EDP at 20%: $0.0006 \times 0.20 = \mathbf{0.00012\%}$ → below 0.001% → not required on the label (but record it and give the data to your assessor).

11.5 How allergens appear on a label

In the UK/EU, allergens above the threshold are listed **by their INCI name** in the ingredient list, typically after "Parfum" (or "Aroma"). For example:

Alcohol Denat., Parfum (Fragrance), Aqua (Water), Limonene, Linalool, Coumarin, Citral.

(Order and exact content depend on your product. Ingredients are listed in descending order of weight at the time they are added; ingredients in concentrations of less than 1% may be listed in any order after those above 1%. An allergen present above 1% — possible in a perfume — must therefore take its correct place in the descending order.)

12. CPSR — Cosmetic Product Safety Report

12.1 What it is

The **CPSR** is the documented safety assessment of a **finished cosmetic product**, required under **Article 10 and Annex I** of the Cosmetics Regulation (UK and EU). It must be completed **before** the product is placed on the market.

12.2 Part A and Part B

Part	Name	Contents (summary of Annex I)
Part A	Cosmetic product safety information	1. Quantitative and qualitative composition · 2. Physical/chemical characteristics and stability · 3. Microbiological quality · 4. Impurities, traces, information about the packaging material · 5. Normal and reasonably foreseeable use · 6. Exposure to the product · 7. Exposure to the substances · 8. Toxicological profile of the substances · 9. Undesirable effects and serious undesirable effects · 10. Information on the product
Part B	Cosmetic product safety assessment	1. Assessment conclusion · 2. Labelled warnings and instructions of use · 3. Reasoning · 4. Assessor's credentials and approval of Part B

12.3 The safety assessor

The assessor must hold a qualification (diploma or equivalent) in **pharmacy, toxicology, medicine, or a similar discipline** (Article 10(2)). The assessor:

- reviews all Part A data;
- evaluates every ingredient (including the fragrance, often using IFRA certificates **plus** allergen and composition data);
- considers exposure, target users (adults? children?), and area of application;
- concludes whether the product is safe, and specifies required **warnings**.

12.4 Documents a perfumer/brand may need to provide

Document/information	Why the assessor needs it
Full formula of the finished product (% w/w), including alcohol, water, denaturant, UV filters, colourants, antioxidants	Part A1 composition
Fragrance concentrate composition or a confidential disclosure to the assessor (if the fragrance supplier won't reveal the formula to you, they may send it directly to the assessor)	Toxicological evaluation
INCI names for all ingredients	Labelling and identification
Allergen declaration for the concentrate	Labelling and sensitisation risk
SDS for the concentrate and raw materials	Hazard data
IFRA documentation (current Amendment)	Evidence of compliance with industry standards
Specifications/COAs (e.g. alcohol/denaturant specs)	Purity, impurities
Stability and compatibility data	Part A2 & A4

Document/information	Why the assessor needs it
Packaging information (material, pump/closure)	Part A4
Intended use and target consumer, amount applied, frequency	Exposure calculation
Manufacturing information (process, GMP)	Quality, impurities
Microbiological information (if relevant — hydroalcoholic perfumes with high alcohol are generally low-risk, but the assessor decides)	Part A3
Label artwork	Part B2 warnings; checking claims

12.5 An IFRA Certificate does NOT replace a CPSR

IFRA Certificate	CPSR
Covers the fragrance concentrate only	Covers the whole finished product
Checks against IFRA Standards	Checks against law + toxicology + exposure
Issued by the fragrance supplier	Signed by a qualified safety assessor
Industry self-regulation	Legal requirement (UK/EU)

13. Product Information File (PIF)

13.1 What it is

The **PIF** is the complete technical file for a cosmetic product, required under **Article 11** of the Cosmetics Regulation (UK/EU). It must be kept readily accessible to the competent authority (e.g. Trading Standards in GB; national authorities in EU Member States) at the address of the Responsible Person given on the label.

13.2 Who is responsible

The **Responsible Person** maintains the PIF.

13.3 What it contains (Article 11(2))

1. A **description** of the cosmetic product (enabling the PIF to be clearly linked to the product);
2. The **CPSR**;
3. A description of the **method of manufacturing** and a statement of compliance with **GMP**;
4. **Proof of the effect claimed**, where justified by the nature or effect of the product (e.g. "lasts 12 hours");
5. Data on any **animal testing** performed by the manufacturer, its agents or suppliers relating to the development or safety assessment of the product or its ingredients.

In practice, a PIF also holds supporting files: raw-material documents, IFRA certificates, allergen declarations, stability data, label artwork, batch records, etc.

13.4 How long must it be kept?

In the UK and EU: **10 years** following the date on which the **last batch** of the product was placed on the market.

13.5 CPSR vs PIF

The **CPSR is one part of the PIF**. Think of the PIF as the binder; the CPSR is the most important chapter.

14. UK Cosmetic Compliance

This section covers **Great Britain (England, Scotland, Wales)**. **Northern Ireland** generally follows the EU Cosmetics Regulation under the Windsor Framework — check current guidance if you sell there.

Key law: Regulation (EC) No 1223/2009 as it applies in Great Britain (the "UK Cosmetics Regulation"), enforced under the Cosmetic Products Enforcement Regulations 2013. The regulator is the **Office for Product Safety and Standards (OPSS)**; enforcement is by **Trading Standards**.

Primary guidance: [GOV.UK — Making cosmetic products available to consumers in Great Britain](#)

14.1 Overview checklist

Requirement	What it means for a perfume brand
Responsible Person (RP)	Every cosmetic product needs a UK-established RP (a business or an individual, including a sole trader). Mail-forwarding or PO box addresses do not count. The RP is legally responsible for compliance. This can be you if you are UK-based.
SCPN notification	Before the product is made available in GB, the RP must notify it through the Submit Cosmetic Product Notifications service. (GOV.UK — Submit a cosmetic product notification ; SCPN service)
CPSR	Required before sale (Section 12).
PIF	Kept at the RP's UK address for 10 years after the last batch (Section 13).
GMP	Manufacture must comply with GMP; ISO 22716 is the recognised standard.
Ingredient restrictions	Check the GB Annexes (II prohibited, III restricted, IV colourants, V preservatives, VI UV filters). GB and EU Annexes can diverge over time.
Serious undesirable effects	Must be reported to OPSS.

14.2 Labelling (Article 19) — what goes on the pack

Label element	Notes for perfume
Name and address of the Responsible Person	UK address for GB. May be abbreviated if the RP can still be identified.
Country of origin	For imported products.
Nominal content (quantity)	By weight or volume (perfume is normally in ml), at time of packaging. Very small packs (e.g. < 5 ml/5 g samples, free samples) have exemptions — check.
Date of minimum durability OR Period After Opening (PAO)	A "best before end" date is required if the product's durability is 30 months or less . If durability exceeds 30 months, a PAO symbol (open jar) may be required — but PAO is not required where there is no risk of deterioration after opening. Whether an alcohol-based perfume needs a PAO is a judgement to confirm with your safety assessor.
Precautions / warnings	Any warnings identified in the CPSR or required by Annexes (e.g. flammability wording, "avoid contact with eyes", "keep away from sunlight" where relevant).
Batch number	Or reference allowing identification of the batch.
Function of the product	Unless clear from presentation ("Eau de Parfum" usually suffices).
Ingredient list	Preceded by "Ingredients". INCI names; descending order of weight for ingredients > 1%; fragrance listed as "Parfum"; labelled allergens above threshold listed by name.

Where space is too small (e.g. mini samples), some information may be given on an enclosed leaflet, label, tag, or card — with a reference symbol on the pack. Check exact rules.

IMPORTANT

changes in GB law

GB is updating its Annexes independently of the EU (for example, the draft Cosmetic Products (Restriction of Chemical Substances) Regulations 2026 notified to the WTO in late 2025 adds substances to GB Annex II). Check GOV.UK and OPSS for the current position rather than assuming the EU and GB are identical.

15. EU Cosmetic Compliance

Key law: [Regulation \(EC\) No 1223/2009 on cosmetic products](#) (the "EU Cosmetics Regulation"), directly applicable in all EU Member States (and relevant to Northern Ireland under the Windsor Framework). Primary guidance: [European Commission — Cosmetics](#)

IMPORTANT

UK and EU are separate

Selling in **both** GB and the EU requires **two** Responsible Persons (one UK-established, one EU-established — which can be two different companies), **two** notifications (SCPN and CPNP), and labels that show the correct RP address(es) for each market. An EU RP cannot act as the GB RP, and vice versa.

15.1 Overview checklist

Requirement	EU details
EU Responsible Person	Must be established in the EU (Article 4). For products manufactured outside the EU, the importer is RP unless they designate someone else in writing. UK brands typically appoint a paid EU RP service.
CPNP notification	Before placing on the market, the RP notifies the product via the Cosmetic Products Notification Portal (Article 13). One notification covers the whole EU. (CPNP information ; CPNP portal)
Safety assessment / CPSR	Article 10 & Annex I. (Commission guidelines on Annex I)
PIF	Article 11; kept at the EU RP's address, in a language easily understood by the competent authority of that Member State; retained 10 years after last batch.
GMP	Article 8; compliance with EN ISO 22716 gives a presumption of conformity.
Ingredient Annexes	Annex II (prohibited), III (restricted incl. allergen labelling), IV–VI (colourants, preservatives, UV filters). Use CosIng for reference but always check the legal text (CosIng is informative, not legally binding).
Labelling	Article 19 — similar elements to the UK list above, plus language requirements : the labelling language is set by each Member State where the product is sold.
Allergens	Expanded list under Regulation (EU) 2023/1545 — see Section 11.
Claims	Must comply with the common criteria (Regulation (EU) No 655/2013).
Serious undesirable effects	Must be notified to the competent authority.

IMPORTANT

keep watching EU law

The EU regularly amends the Annexes (e.g. banning substances classified as CMR under CLP). Changes can apply quickly. Check the consolidated text of Regulation 1223/2009 on EUR-Lex and the Commission's cosmetics pages regularly.

16. United States Overview

The US system is **structurally different** from the UK/EU. This is a high-level overview — if you sell into the US, consult current FDA resources or a US regulatory professional.

16.1 Legal framework

- **Federal Food, Drug, and Cosmetic Act (FD&C Act)** — cosmetics must not be **adulterated** or **misbranded**.
- **Fair Packaging and Labeling Act (FPLA)** — labelling of consumer products, e.g. identity, net quantity, name and place of business.
- **Modernization of Cosmetics Regulation Act of 2022 (MoCRA)** — the biggest change to US cosmetic law since 1938. ([FDA — MoCRA](#))
- Federal ingredient labelling rules (21 CFR 701.3) — historically allow fragrance to be declared simply as "**Fragrance**".
- **Cosmetic vs drug**: claims matter. A product claiming to treat or prevent disease, or affect body structure/function, may be regulated as a **drug**.
- **State laws** also apply (for example, California has fragrance-ingredient disclosure/reporting requirements and ingredient bans). These are outside the scope of this guide — check the relevant state.

16.2 Key MoCRA obligations (as of writing — verify on FDA's site)

Obligation	Summary
Facility registration	Facilities that manufacture or process cosmetics for US distribution must register with FDA.
Product listing	The "responsible person" (manufacturer, packer or distributor named on the label) must list each product, including ingredients. (FDA — Registration & Listing)
Small business exemption	Certain small businesses (MoCRA sets a gross-sales threshold) are exempt from registration/listing — but not for certain higher-risk product types, and not from other obligations such as adverse event reporting and safety substantiation. See the FDA Small Businesses & Homemade Cosmetics fact sheet .
Safety substantiation	The responsible person must ensure and maintain records supporting adequate substantiation of safety .
Adverse event reporting	Serious adverse events must be reported to FDA (within 15 business days of receiving the information); records of adverse events must be kept.
Label contact information	Labels must include domestic contact information (address, phone number or electronic contact) through which adverse events can be reported.
GMP	FDA is required to establish cosmetic GMP regulations; check current status.
Fragrance allergen labelling	MoCRA requires FDA to issue a rule on fragrance allergen labelling . The statutory deadline for the proposed rule (June 2024) was missed; FDA's regulatory agenda has indicated a proposed rule during 2026. At the time of writing, check FDA's site for whether a proposed or final rule has been published. (reginfo.gov entry)
Recalls	FDA has mandatory recall authority under MoCRA.

16.3 Where IFRA fits in the US

IFRA Standards are not US federal law. However, they are widely used by the fragrance industry, are expected by customers and retailers, and are commonly used as part of **safety substantiation**.

Most fragrance suppliers will issue IFRA Certificates regardless of market.

COMMON MISTAKE

"The US has no rules for cosmetics, so I don't need anything." Since MoCRA, obligations have expanded significantly, and the underlying adulteration/misbranding law has always applied.

17. SDS, CLP and Transport

17.1 Three separate systems

System	Governs	Legal basis (examples)	Applies to perfumers when...
Cosmetic compliance	Safety, labelling and notification of finished cosmetics	UK/EU Cosmetics Regulation; FD&C Act/MoCRA	You place a perfume on the market for consumers.
Chemical hazard classification	Hazard communication for substances and mixtures (raw materials, concentrates)	EU CLP Regulation (EC) No 1272/2008; GB CLP; REACH/UK REACH (SDS); US OSHA HazCom for workplaces	You buy, store, handle, or supply raw materials or fragrance concentrates.
Transport of dangerous goods	How hazardous goods may be moved by road, air, sea, post	UN Model Regulations; ADR (road, Europe/GB); IATA DGR / ICAO TI (air); IMDG Code (sea); US 49 CFR (HMR); postal operators' own rules	You ship anything flammable or otherwise hazardous — including finished perfume.

These systems have **different purposes**, so the same product can be exempt from one and fully regulated by another.

EXAMPLE

A finished EDP in a 50 ml bottle: - **Cosmetics law**: fully applies (CPSR, labelling, etc.). - **CLP labelling**: does **not** apply to the finished cosmetic (cosmetics in their finished state intended for the end user are exempt from CLP labelling). - **Transport**: it **is** a flammable liquid — typically **UN 1266, Perfumery products with flammable solvents, Class 3** — and transport rules apply when it's shipped.

EXAMPLE

A 1 kg bottle of fragrance concentrate supplied to another business: - **Cosmetics law**: it is not a finished cosmetic. - **CLP**: applies — hazard classification and label (pictograms, signal word, hazard and precautionary statements, UFI where required in the EU). - **SDS**: required if the mixture is classified as hazardous (or meets other REACH Article 31 criteria). - **Transport**: depends on its flash point and other hazards (many concentrates are also classified as environmentally hazardous).

IMPORTANT

CLP is changing

The EU revised CLP in 2024 (Regulation (EU) 2024/2865, in force since 10 December 2024). Some of its new rules — including label formatting, advertising and distance-selling provisions — were later postponed to **1 January 2028** by Regulation (EU) 2025/2439. GB CLP is separate and does not automatically follow EU changes. If you supply concentrates, keep your classification and labels up to date and check the current application dates.

17.2 Alcoholic perfume — the concepts

- **Flammability**: perfumer's alcohol (ethanol) is highly flammable. Finished perfumes with a high alcohol content are flammable liquids.

- **Flash point:** the lowest temperature at which vapours can ignite in air. Ethanol-based perfumes have low flash points — that's why they are dangerous goods.
- **Dangerous goods classification:** alcoholic perfumes are typically shipped as **UN 1266 "Perfumery products with flammable solvents", Class 3 (flammable liquids)**, with a **packing group** (II or III) that depends on flash point and boiling point.
- **Transport restrictions:** each mode (road, air, sea, post) has its own rules on packaging, quantities, marking, labelling, documentation and staff **training**. Air transport is the strictest. Some carriers and postal services restrict or refuse flammable liquids or only accept them under specific conditions. Provisions such as **limited quantities** exist in the regulations, but they come with their own conditions and training requirements.

IMPORTANT

Shipping fragrance internationally may require **different documentation** from selling it as a cosmetic — for example dangerous goods declarations, proper packaging, marks and labels, the SDS transport section, and carrier approval. **Always follow the dangerous-goods rules.** Never mis-declare perfume or concentrates as non-hazardous goods — it is illegal and creates a genuine fire risk for transport workers and aircraft. If unsure, talk to your carrier's dangerous-goods team or a qualified Dangerous Goods Safety Adviser (DGSA).

18. Common IFRA Mistakes

COMMON MISTAKE

Mistake 1 — Comparing concentrate % directly with a finished-product IFRA limit

"Material X is 3% of my concentrate; the Category 4 limit is 0.6%, so I'm over." — Not necessarily. IFRA limits apply to the **finished product**.

Avoid it: always calculate $\text{material \% in concentrate} \times \text{dosage} \div 100$ before comparing (Section 5).

COMMON MISTAKE

Mistake 2 — Forgetting to account for perfume dilution the other way round

"My concentrate is compliant, so any dosage is fine." — The concentrate is only compliant **up to** its maximum dosage.

Avoid it: always record the maximum Category 4 dosage and never exceed it in the finished product.

COMMON MISTAKE

Mistake 3 — Forgetting raw-material dilutions

Counting 5% of a 10% solution as 5% active (overestimating), or forgetting that a supplier material was already diluted (under- or over-estimating).

Avoid it: have a **dilution %** column and calculate **active %** for every line (Section 7).

COMMON MISTAKE

Mistake 4 — Using outdated IFRA certificates

A 48th- or 49th-Amendment certificate is not evidence of 51st-Amendment compliance.

Avoid it: record the Amendment on every document; request updates when a new Amendment is notified (the 52nd is expected late 2026).

COMMON MISTAKE

Mistake 5 — Relying only on CAS numbers

A search by one CAS number returns nothing, so the material is assumed unrestricted.

Avoid it: search by **name, synonyms, and all CAS numbers**; check constituents for mixtures and naturals (Section 4.3).

COMMON MISTAKE

Mistake 6 — Assuming "natural" means unrestricted

Avoid it: naturals can be restricted themselves and contain restricted and allergenic constituents (Section 8).

COMMON MISTAKE

Mistake 7 — Forgetting restricted constituents inside naturals

Methyl eugenol from basil or rose, citral from lemongrass, furocoumarins from bergamot, eugenol from clove...

Avoid it: use supplier composition data and **sum all sources** of each restricted substance.

COMMON MISTAKE

Mistake 8 — Confusing allergens with IFRA restrictions

"Linalool isn't IFRA-limited, so I don't need to label it." Allergen labelling is a separate **legal** requirement.

Avoid it: calculate allergens separately against 0.001% / 0.01% thresholds (Section 11).

COMMON MISTAKE

Mistake 9 — Assuming an SDS proves cosmetic compliance

Avoid it: an SDS is a chemical-hazard document. Use it for handling, CLP and transport — not as cosmetic or IFRA evidence.

COMMON MISTAKE

Mistake 10 — Assuming an IFRA certificate equals a CPSR

Avoid it: the CPSR is a legal requirement for the whole product, signed by a qualified assessor (Section 12).

COMMON MISTAKE

Mistake 11 — Using supplier usage recommendations as if they were legal limits

"Up to 5% in concentrate" on a TDS may be an odour/performance suggestion, not an IFRA or legal limit — and it could be higher or lower than the actual restriction.

Avoid it: use the **IFRA Standard** and **law** for limits; treat supplier recommendations as advice.

COMMON MISTAKE

Mistake 12 — Forgetting that Category 4 limits apply to finished-product exposure

Using the Category 4 limit as a % of the concentrate, or applying it to a lotion or body mist.

Avoid it: Category limits = % in the **finished product**, for **that product type** only.

COMMON MISTAKE

Mistake 13 — Treating parts by weight as percentages

A formula written as "Iso-style woody 150 parts, musk 300 parts ... total 870 parts" — reading "150" as 15% is wrong: $150 \div 870 \times 100 = 17.24\%$.

Avoid it: always convert parts to % with $\text{part} \div \text{total parts} \times 100$ before any IFRA calculation.

COMMON MISTAKE

Mistake 14 — Failing to renormalise formulas properly

You add 20 parts of a new material to a 1000-part formula and keep the old percentages. Every percentage has changed: the total is now 1020 parts, so a material at 50 parts drops from $50 \div 1000 \times 100 = 5.00\%$ to $50 \div 1020 \times 100 = \mathbf{4.90\%}$, and the new material is $20 \div 1020 \times 100 = \mathbf{1.96\%}$.

Avoid it: let a spreadsheet recalculate % from parts automatically; check the % column sums to 100.00.

COMMON MISTAKE

Mistake 15 — Ignoring purity or active concentration

A material sold as "~50% active in a carrier", or a natural isolate of limited purity.

Avoid it: read the specification; adjust the active % accordingly.

COMMON MISTAKE

Mistake 16 — Mixing documentation from different versions of the same raw material

Using supplier A's allergen declaration with supplier B's oil, or last year's spec with this year's re-formulated base.

Avoid it: file documents by **supplier + product code + date**; when you change supplier, get a full new set of documents.

COMMON MISTAKE

Mistake 17 — Measuring by volume and calculating by weight

Avoid it: weigh everything (Section 5.6).

COMMON MISTAKE

Mistake 18 — Formulating exactly at the limit

Avoid it: leave a margin for weighing tolerance and natural batch variation.

19. Worked Compliance Example

READ FIRST

Everything in this example is **fictional**. Material names are invented; **all IFRA limits and constituent percentages are HYPOTHETICAL educational numbers** and must **not** be used in real formulas. Only the allergen labelling thresholds (0.001% / 0.01%) and the allergen status of limonene and linalool are real.

19.1 The brief

A small brand wants an **Eau de Parfum** (IFRA **Category 4**, leave-on) at **20% w/w** concentrate in perfumer's alcohol.

19.2 Step 1 — The formula (in parts by weight)

#	Material	Type	Parts	Formula %	Dilution %	Active %
1	"Musk M"	Synthetic musk	235	23.50	100	23.50
2	"Woody W"	Synthetic woody	150	15.00	100	15.00
3	"Floral F"	Synthetic floral	200	20.00	100	20.00
4	Linalool	Aroma chemical (real allergen)	40	4.00	100	4.00
5	"Citrus Oil C"	Essential oil (fictional)	120	12.00	100	12.00
6	"Restricted R1"	Restricted material	20	2.00	100	2.00
7	"Restricted R2" 10% in DPG	Restricted, diluted	50	5.00	10	0.50
8	"Aldehyde A" 1% in DPG	Diluted	30	3.00	1	0.03
9	"Vanillic V" 50% in DPG	Diluted	40	4.00	50	2.00
10	"Amber X"	Synthetic amber	60	6.00	100	6.00
11	"Green G" 10% in DPG	Diluted	20	2.00	10	0.20
12	"Fruity E"	Synthetic fruity	15	1.50	100	1.50
13	DPG	Solvent	20	2.00	—	(solvent)
	Total		1000	100.00		

19.3 Step 2 — Normalise and calculate active %

Normalising: Formula % = parts ÷ total parts × 100. Total = 1000 parts, e.g. Musk M = $235 \div 1000 \times 100 = 23.50\%$.

Sum check: $23.5 + 15 + 20 + 4 + 12 + 2 + 5 + 3 + 4 + 6 + 2 + 1.5 + 2 = 100.00 \checkmark$

Active % for diluted lines: - R2: $5.00 \times (10 \div 100) = 0.50\%$ (DPG = $5.00 - 0.50 = 4.50\%$) -

Aldehyde A: $3.00 \times (1 \div 100) = 0.03\%$ (DPG = 2.97%) - Vanillic V: $4.00 \times (50 \div 100) = 2.00\%$ (DPG = 2.00%) - Green G: $2.00 \times (10 \div 100) = 0.20\%$ (DPG = 1.80%)

Total DPG in the concentrate = $4.50 + 2.97 + 2.00 + 1.80 + 2.00$ (neat) = **13.27%**

19.4 Step 3 — Identify restricted materials and constituents

From supplier documents (fictional) and the IFRA Standards Library (hypothetical limits):

Substance	Sources in formula	Supplier data (HYPOTHETICAL)	Cat 4 limit (HYPOTHETICAL)
R1	Line 6 (neat)	—	0.50%
R2	Line 7 (10% dilution)	—	0.12%
Constituent K	Citrus Oil C (line 5) and Floral F (line 3)	Oil C contains 0.40% K; Floral F contains 0.05% K	0.015%
Limonene	Citrus Oil C	Oil C contains 35% limonene	Allergen (label > 0.001%); IFRA oxidation specification — confirm supplier compliance
Linalool	Line 4 + Citrus Oil C	Oil C contains 15% linalool	Allergen (label > 0.001%); IFRA oxidation specification — confirm supplier compliance
"Allergen Y" (placeholder for any listed allergen)	Woody W	Woody W contains 0.02% Y	Allergen threshold only

All other materials: the (fictional) suppliers' IFRA documents state no Standards apply. (*In real life you would verify each one yourself — Section 22.*)

19.5 Step 4 — Calculate each restricted substance in the concentrate

- **R1:** 2.00% (neat) → **2.00%**
- **R2:** active = **0.50%**
- **Constituent K:**
 - from Citrus Oil C: $12.00 \times (0.40 \div 100) = 12 \times 0.004 = \mathbf{0.048\%}$
 - from Floral F: $20.00 \times (0.05 \div 100) = 20 \times 0.0005 = \mathbf{0.010\%}$
 - **Total K** = $0.048 + 0.010 = \mathbf{0.058\%}$

19.6 Step 5 — Finished-product exposure at 20% dosage

Substance	% in concentrate	× dosage fraction	% in finished EDP	Hypothetical limit	Result
R1	2.00	× 0.20	0.400%	0.50%	✓ Pass
R2	0.50	× 0.20	0.100%	0.12%	✓ Pass
K	0.058	× 0.20	0.0116%	0.015%	✓ Pass

19.7 Step 6 — Maximum fragrance dosage per substance

Material	% in concentrate	Cat 4 limit (HYPOTHETICAL)	Calculation	Maximum fragrance dosage
R1	2.00%	0.50%	$0.50 \div 2.00 = 0.2500$	25.0%
R2	0.50%	0.12%	$0.12 \div 0.50 = 0.2400$	24.0% ← lowest

Material	% in concentrate	Cat 4 limit (HYPOTHETICAL)	Calculation	Maximum fragrance dosage
Constituent K	0.058%	0.015%	$0.015 \div 0.058 = 0.2586$	25.9%

19.8 Step 7 — The limiting material

R2 is the limiting material. Maximum Category 4 dosage of this concentrate = **24.0%**.

- The planned **20% EDP** is below 24.0% → ✓ compliant with the (hypothetical) IFRA limits.
- If the brand later wanted a **25% Extrait**: R2 would be $0.50 \times 0.25 = \mathbf{0.125\%} > 0.12\%$ ✗. They would need to reduce R2 to $\leq 0.12 \div 0.25 = \mathbf{0.48\%}$ active (i.e. $\leq 4.80\%$ of the 10% dilution), and then re-check R1 ($2.00 \times 0.25 = 0.50\%$ — exactly at its limit, with no safety margin) and K ($0.058 \times 0.25 = 0.0145\%$ — just under). In practice they would reformulate with more headroom.

19.9 Step 8 — Allergen calculation (leave-on, threshold 0.001%)

Allergen	Sources	Calculation in concentrate	% in concentrate	In EDP at 20%	Label?
Linalool	Line 4 + Oil C	$4.00 + (12.00 \times 15 \div 100) = 4.00 + 1.80$	5.80%	$5.80 \times 0.20 = \mathbf{1.16\%}$	✓ Yes (> 0.001%)
Limonene	Oil C	$12.00 \times 35 \div 100$	4.20%	$4.20 \times 0.20 = \mathbf{0.84\%}$	✓ Yes
Allergen Y	Woody W	$15.00 \times 0.02 \div 100 = 15 \times 0.0002$	0.003%	$0.003 \times 0.20 = \mathbf{0.0006\%}$	✗ No (below 0.001%) — record it anyway

Resulting ingredient list (simplified, EU/UK style): *Alcohol Denat., Parfum (Fragrance), Aqua (Water) [if used], Linalool, Limonene* — plus any other allergens that the full declarations reveal above threshold, and any other ingredients (e.g. denaturants, UV filters, antioxidants, colourants).

Note: linalool (1.16%) is above 1%, so it must sit in its correct descending-order position; limonene (0.84%) is below 1% and may follow in any order. This list assumes any water present is above 1.16%.

19.10 Step 9 — Documents to obtain and file

For...	Documents
Every raw material (13 lines)	SDS · IFRA document (current Amendment) · allergen declaration (expanded EU list) · specification/TDS · COA per batch
Citrus Oil C	Also GC/MS or composition data; confirmation of specification compliance (e.g. phototoxicity-related Standards for citrus oils — check the relevant Standard, especially after the 52nd Amendment)
Linalool, Limonene-containing materials	Confirmation of compliance with IFRA oxidation specifications (e.g. antioxidant use / peroxide value)
The concentrate	Formula records with calculations · IFRA conformity document · allergen declaration · SDS & CLP label (if supplied as a mixture)
Finished EDP	Full formula incl. alcohol & denaturant specs · stability/compatibility data · packaging specs · label artwork · CPSR · GMP/batch records · notification (SCPN/CPNP) · PIF

20. Compliance Workflow for a Perfumer

Printable checklist — tick each box for every new product or formula change.

PERFUMERY COMPLIANCE WORKFLOW

Product: _____

Formula version: _____

Date: _____

- ☐ STEP 1 Obtain documentation for every raw material
 - ☐ SDS ☐ IFRA document ☐ Allergen declaration
 - ☐ Specification/TDS ☐ COA for batch used
- ☐ STEP 2 Record for each material:
 - ☐ Trade name ☐ Supplier ☐ Product code
 - ☐ CAS / botanical name ☐ Dilution % ☐ Document dates
- ☐ STEP 3 Build the fragrance formula (by WEIGHT)
- ☐ STEP 4 Normalise the formula to 100%
 - ☐ % column sums to 100.00
 - ☐ Active % calculated for every diluted material
- ☐ STEP 5 Identify restricted materials AND constituents
 - ☐ Direct materials ☐ Constituents of naturals and bases
 - ☐ Prohibited materials absent ☐ Specifications met
- ☐ STEP 6 Check the CURRENT IFRA Standards
Amendment used: _____ Date checked: _____
- ☐ STEP 7 Calculate maximum usage for the relevant IFRA category
Category: _____ Limiting material: _____
Max dosage: _____% Planned dosage: _____% Margin OK? ☐
- ☐ STEP 8 Calculate allergens (all sources)
Market list used: ☐ EU expanded ☐ GB ☐ other
Leave-on (0.001%) / Rinse-off (0.01%) Allergens to label: _____
- ☐ STEP 9 Create fragrance documentation
 - ☐ IFRA conformity doc ☐ Allergen declaration
 - ☐ SDS & CLP label (if supplying the concentrate)
- ☐ STEP 10 Submit information to safety assessor / Responsible Person
 - ☐ Full formula ☐ Supporting documents ☐ Stability data
 - ☐ Packaging info ☐ Label artwork
- ☐ STEP 11 Complete finished-product regulatory steps
 - ☐ CPSR signed ☐ PIF complete ☐ GMP records
 - ☐ Notification: ☐ SCPN (GB) ☐ CPNP (EU) ☐ FDA listing (US, if applicable)
 - ☐ Label checked ☐ Transport/DG arrangements for shipping
- ☐ STEP 12 Re-check compliance whenever:
 - ☐ Formula changes ☐ Supplier or raw-material grade changes
 - ☐ New IFRA Amendment ☐ Regulation changes (GB/EU/US)
 - ☐ New supplier documents issuedNext scheduled review date: _____

GOOD PRACTICE

Set a calendar reminder to review all live products at least **once a year**, and immediately after any IFRA Amendment notification or relevant change in law.

21. Compliance Spreadsheet Structure

A well-built spreadsheet turns compliance into a routine task. Below is a suggested layout for Excel or Google Sheets.

21.1 Suggested columns

Put the **finished-product dosage** (e.g. 20) in a fixed cell, say **\$B\$1**, and the table header in row 3, data from row 4.

Col	Header	Content / formula (row 4)
A	Material name	Text
B	Supplier	Text
C	Supplier product code	Text
D	CAS	Text (format column as Text so leading zeros/dashes aren't lost)
E	Parts (weight)	Number you weigh
F	Formula %	<code>=E4/SUM(\$E\$4:\$E\$50)*100</code>
G	Dilution %	Number (100 for neat)
H	Active %	<code>=F4*G4/100</code>
I	Finished product %	<code>=H4*\$B\$1/100</code>
J	IFRA restricted?	Yes / No / Spec only
K	IFRA restriction type	Prohibition / Restriction / Specification
L	Category 4 maximum (%)	From the current IFRA Standard
M	Maximum fragrance dosage (%)	<code>=IF(AND(ISNUMBER(L4),H4>0),L4/H4*100,"")</code>
N	Pass at planned dosage?	<code>=IF(ISNUMBER(L4),IF(I4<=L4,"OK","EXCEEDS"),"")</code>
O	Allergens present	Text (from allergen declaration)
P	Allergen % in material	Number
Q	Allergen % contributed to concentrate	<code>=H4*P4/100</code> (uses active %, so diluted materials are counted correctly)
R	SDS available?	Y/N
S	IFRA document available?	Y/N
T	Allergen declaration available?	Y/N
U	Specification available?	Y/N
V	Date documents checked	Date
W	IFRA Amendment/version	e.g. "51st"

Note: M uses the active % from column H. For substances coming from several sources (constituents), use a **separate constituents table** (below) rather than a single row.

21.2 Summary cells

Total formula %	=SUM(F4:F50)	→ should equal 100
Limiting maximum dosage (%)	=MIN(M4:M50)	
Limiting material	=INDEX(A4:A50, MATCH(MIN(M4:M50), M4:M50, 0))	
Planned dosage OK?	=IF(\$B\$1<=MIN(M4:M50), "OK", "REDUCE DOSAGE OR REFORMULATE")	
Any failures?	=COUNTIF(N4:N50, "EXCEEDS")	
Missing documents	=COUNTIF(R4:U50, "N")	

21.3 Constituents and allergens table (recommended)

Because allergens and restricted constituents come from several materials, use a **matrix** on a separate tab: one row per material, one column per substance, cells = % of that substance in the **neat** material (from supplier documents). Column B holds each material's **active %** (not formula %), so diluted materials are counted correctly.

Material	Active %	Linalool % in material	Limonene % in material	Constituent K % in material	...
Linalool	4.00	100	0	0	
Citrus Oil C	12.00	15	35	0.40	
Floral F	20.00	0	0	0.05	

Totals row (for each substance column, e.g. Linalool in column C, active % in column B, rows 4-50; the dosage cell lives on the main tab, here called Main):

% in concentrate	=SUMPRODUCT(\$B\$4:\$B\$50, C4:C50)/100
% in finished product	=([cell above]*Main!\$B\$1)/100
Label? (leave-on)	=IF([finished cell]>0.001, "LABEL", "")
Label? (rinse-off)	=IF([finished cell]>0.01, "LABEL", "")
Max dosage (restricted substance)	=IFERROR([limit]/[% in concentrate]*100, "")

GOOD PRACTICE

- Lock formula columns to avoid accidental overwrites.
- Keep one tab per formula **version**; never overwrite an old version that has been sold.
- Keep a "Sources" tab listing every document, its version, date and where it's stored.
- Use conditional formatting to highlight "EXCEEDS", "LABEL" and missing documents.

22. How to Research an Ingredient Properly

A repeatable process for every new raw material:

Step	Action	Record
1	Check supplier IFRA documentation for the exact product code. Note the Amendment and date.	Amendment, date, max levels per category
2	Check the supplier SDS — identity (Section 1, 3), hazards (Section 2), flash point (Section 9), transport (Section 14).	Hazard classes, CAS/EC numbers
3	Check the supplier allergen declaration — which list it covers (26 vs expanded EU list) and the %.	Allergens and %
4	Search the official IFRA Standards Library by name, synonyms and each CAS number.	Standard found? Type? Cat 4 limit? Notes?
5	Confirm identity — CAS, synonym, INCI name, and for naturals the botanical name , plant part, extraction method. Compare with the specification.	Confirmed identity
6	Check constituent-based restrictions — for naturals and bases, check composition data for restricted constituents and the IFRA annex on contributions from other sources.	Constituents and %
7	Check the law for your markets — EU Annex II/III (via EUR-Lex and CosIng), GB Annexes, any US requirements.	Legal status
8	Record the source and date checked for every fact.	Source + date

IMPORTANT

hierarchy of sources

1. **Official texts** (IFRA Standards, EUR-Lex, legislation.gov.uk, GOV.UK, FDA) and **your supplier's documents for the exact material you bought**;
2. Recognised reference sources (e.g. IFRA's annexes, the Commission's CosIng database — which is informative, not legally binding);
3. Third-party websites, forums, blogs, and unofficial databases.

Random online databases can be **out of date or simply wrong**. They should **not** override primary supplier documentation or official regulatory sources. Use them, at most, as a prompt to go and check the official source.

23. Glossary

Term	Definition
Active material	The actual aromatic substance present, excluding any solvent or carrier it's diluted in.
Allergen	In this guide, a fragrance substance listed in the Cosmetics Regulation (Annex III) that must be named on the label above a threshold, because it can cause allergic contact dermatitis in sensitised people.
CAS (CAS number)	A unique identifier assigned to a chemical substance by the Chemical Abstracts Service (e.g. format 00000-00-0).
CLP	EU Regulation (EC) No 1272/2008 on Classification, Labelling and Packaging of substances and mixtures (GB has its own "GB CLP").
COA	Certificate of Analysis — batch-specific test results against the specification.
Concentrate	The fragrance oil / compound before dilution into the finished product (also "fragrance compound", "juice" concentrate).
CPNP	Cosmetic Products Notification Portal — the EU's online system for notifying cosmetic products.
CPSR	Cosmetic Product Safety Report — the legally required safety assessment of a finished cosmetic (UK/EU), Parts A and B.
Dilution	A solution of a material in a solvent (e.g. 10% in DPG). The dilution % states how much active material is in the solution.
Finished product	The product as sold to and used by the consumer (e.g. the EDP including alcohol). IFRA limits apply here.
Flash point	The lowest temperature at which a liquid gives off enough vapour to ignite in air. Key to flammability and transport classification.
GC/MS	Gas Chromatography–Mass Spectrometry — the lab technique used to identify and quantify components of a mixture, especially naturals.
GMP	Good Manufacturing Practice — controlled, hygienic, documented, traceable manufacture (ISO 22716 for cosmetics).
IFRA	International Fragrance Association — the global fragrance industry body that publishes the IFRA Standards.
IFRA Amendment	A numbered update to the IFRA Standards (e.g. 51st, 52nd), with notification and implementation dates.
IFRA Category	One of IFRA's product types (1–12, with sub-categories) that determine which limit applies. Category 4 = fine fragrance.
INCI	International Nomenclature of Cosmetic Ingredients — standard names used on cosmetic ingredient lists (e.g. "Parfum", "Linalool", "Alcohol Denat.").
PIF	Product Information File — the complete technical dossier for a cosmetic, kept by the Responsible Person for 10 years after the last batch (UK/EU).
Prohibition	An IFRA Standard (or legal provision) stating that a material must not be used.
Responsible Person (RP)	The legal or natural person (UK- or EU-established as appropriate) responsible for a cosmetic's compliance. In the US, MoCRA also uses "responsible person" for the manufacturer, packer or distributor named on the label.
Restriction	An IFRA Standard (or legal provision) limiting the maximum concentration of a material in the finished product.
SCPN	Submit Cosmetic Product Notifications — the GB (UK) notification service run by OPSS.

Term	Definition
SDS	Safety Data Sheet — 16-section hazard communication document for substances/mixtures.
Specification	(1) An IFRA Standard type setting purity/quality criteria; (2) a supplier document describing what a material should be (appearance, purity, density etc.).
TDS	Technical Data Sheet — supplier document describing a material's properties and often usage information.

Additional useful terms: **Annex II / III** (lists of prohibited / restricted cosmetic ingredients), **DGSA** (Dangerous Goods Safety Adviser), **MoCRA** (US Modernization of Cosmetics Regulation Act 2022), **OPSS** (UK Office for Product Safety and Standards), **PAO** (Period After Opening), **QRA** (Quantitative Risk Assessment, used by IFRA/RIFM for sensitisers), **RIFM** (Research Institute for Fragrance Materials), **UFI** (Unique Formula Identifier for EU poison-centre notifications), **UN 1266** (transport entry for perfumery products with flammable solvents).

24. Useful Official Resources

Resource	Use it for...
IFRA Standards Library	Searching the current IFRA Standard for any material by name or CAS.
IFRA Standards overview	Understanding what the Standards are and finding current Amendment news.
IFRA Standards documentation	Downloading the Guidance for the use of IFRA Standards (including the product-category definitions) and related annexes.
IFRA Code of Practice	Reading the framework the IFRA Standards sit within.
IFRA — Understanding the Standards / Using the Standards	Plain-language explanations of how Standards are made and applied.
IFRA — 52nd Amendment consultation	Tracking the upcoming Amendment and its notification.
GOV.UK — Making cosmetic products available to consumers in Great Britain	The main UK guidance on Responsible Persons, safety, labelling and notification.
GOV.UK — Submit a cosmetic product notification	Learning how GB notification works and what information is needed.
SCPN service	Actually submitting GB cosmetic product notifications.
GOV.UK — Consumer products: cosmetics	Broader UK product-safety context for cosmetics.
European Commission — Cosmetics	The EU's hub for cosmetics policy, guidance and news.
European Commission — Cosmetics legislation	Finding the Cosmetics Regulation, amendments and official guidelines (e.g. Annex I/CPSR guidelines).
EU CPNP information / CPNP portal	Understanding and completing EU product notification.
Regulation (EC) No 1223/2009 on EUR-Lex	Reading the legally binding EU Cosmetics Regulation (use the "consolidated version" for the latest Annexes).
Regulation (EU) 2023/1545 on EUR-Lex	Reading the official expanded EU fragrance allergen labelling rules and transition dates.
EU CosIng database	Quickly checking an ingredient's INCI name and EU regulatory status (informative, not legally binding).
FDA — MoCRA	Understanding current US cosmetic obligations and FDA implementation updates (including fragrance allergen rulemaking).
FDA — Registration & Listing	Registering facilities and listing products in the US.
FDA — Small Businesses & Homemade Cosmetics fact sheet	Checking which US obligations apply to small businesses.
ECHA — CLP	Understanding EU chemical hazard classification and labelling for raw materials and concentrates.
HSE — GB CLP	Understanding GB chemical classification and labelling rules.

Perfumery Compliance Cheat Sheet

One page. Print it. Pin it above your scale.

1 2 3 4 Key IFRA formulas (all % by WEIGHT)

NORMALISE	$\text{formula \%} = \text{parts} \div \text{total parts} \times 100$
ACTIVE	$\text{active \%} = \text{formula \%} \times \text{dilution \%} \div 100$
FINISHED	$\text{finished \%} = \text{active \%} \times \text{dosage \%} \div 100$
MAX IN CONC.	$\text{max active \%} = \text{IFRA limit \%} \div (\text{dosage \%} \div 100)$
MAX DOSAGE	$\text{max dosage \%} = \text{IFRA limit \%} \div \text{active \%} \times 100$
LIMITING	lowest max dosage of all restricted substances = max dosage of the formula
ALLERGEN	$\text{conc. \%} = \Sigma(\text{active \%} \times \text{allergen \%} \div 100)$
	$\text{finished \%} = \text{conc. \%} \times \text{dosage \%} \div 100$

Category 4 basics

- Category 4 = **fine fragrance** (EDP, EDT, parfum, cologne, perfume oils...).
- Limits are % **of the finished product**, not of the concentrate.
- Other product types (lotion, soap, candle, body mist) have **other categories and limits** — look them up in IFRA's guidance.

Allergen basics (UK/EU)

- Label by name if the finished product contains > **0.001% (leave-on)** or > **0.01% (rinse-off)**.
- Count **all sources**, including naturals and benzyl benzoate.
- EU**: expanded list (Reg. 2023/1545) for products placed on the market from **31 July 2026**. **GB**: check current OPSS position.

Documents to collect for every raw material

SDS · IFRA document (current Amendment) · Allergen declaration · Specification/TDS · COA · (GC/MS for naturals)

CPSR vs PIF

- CPSR** = safety report for the finished product (Part A data + Part B assessor conclusion). Legal requirement UK/EU.
- PIF** = the whole dossier (product description + CPSR + manufacturing/GMP + claims proof + animal-testing data). Keep 10 years after last batch.
- IFRA certificate ≠ CPSR. SDS ≠ cosmetic compliance.**

The workflow

1 Docs → 2 Record → 3 Build → 4 Normalise → 5 Identify restricted → 6 Check current IFRA → 7 Max dosage → 8 Allergens → 9 Fragrance docs → 10 Assessor/RP → 11 CPSR, PIF, notify, label → 12 Re-check on any change

Market basics

- GB**: UK RP · SCPN · CPSR · PIF · GMP · label.
- EU**: EU RP · CPNP · CPSR · PIF · GMP · label (local languages).
- US**: FD&C Act + MoCRA (registration/listing, safety substantiation, adverse events, label contact info); IFRA is industry practice, not federal law.
- Shipping alcoholic perfume**: dangerous goods (typically **UN 1266, Class 3**) — follow carrier and DG rules.

Top mistakes to avoid

- Comparing concentrate % to a finished-product limit.
- Forgetting dilutions (5% of a 10% solution = 0.5% active).
- Outdated IFRA certificates (check the Amendment — 52nd expected late 2026).
- Searching by CAS only.
- "Natural = unrestricted."
- Missing constituents in naturals.
- Confusing allergen labelling with IFRA limits.
- Treating an SDS or IFRA certificate as a CPSR.
- Treating supplier suggestions as legal limits.
- Parts ≠ percent; renormalise after every change.
- Measuring by volume, calculating by weight.
- Formulating right at the limit with no margin.

This guide is for educational purposes only and is not legal, regulatory or toxicological advice. Regulations and IFRA Standards change over time. Always verify requirements against current official guidance, supplier documentation, and where appropriate a qualified cosmetic safety assessor.
